Chemical Solution Deposition of Semiconductor Film

The deposition of CdO films is achieved using cadmium acetate solutions, consist of 3ml of 1M cadmium acetate ($\text{Cd}(\text{CH}_3\text{COO})_2$) with 5ml of 14.4M ammonium hydroxide solution (NH_4OH) (NH_3 after...

Chemical deposition method PbS crystals were be grown using a chemical solution deposition method in which sulfide ions are produced by the decomposition of thiourea under alkaline conditions. In the presence of Pb^{2+} ions, PbS is precipitated. Solutions of $Pb(ClO_4)_2$ and NaOH were combined, and thiourea (TU) solution added.

Deposition is a process that deposits a blanket of materials on a surface. There are multiple ways to do this, including selective deposition, atomic-layer deposition, chemical vapor deposition and physical vapor deposition. Which technique is used depends upon the process node, the type of chip, and the amount of time needed to do the deposition.

Chemical vapor deposition is a vacuum deposition method used to produce high quality, high-performance, solid materials. The process is often used in the semiconductor industry to produce thin films. In typical CVD, the wafer is exposed to one or more volatile precursors, which react and/or decompose on the substrate surface to produce the desired deposit. Frequently, volatile by-products are also produced, which are removed by gas flow through the reaction chamber. Microfabrication processes wi

6.5.4.3.2 Chemical Solution Deposition. CSD is a very versatile method as it provides excellent stoichiometry control and coverage of large surface areas. The application procedures used for CSD are quite similar to what is used in the semiconductor industry for application of photoresist, which is a proven high throughput process.

It was not commonly used in semiconductor processing for many years, but has seen a resurgence with more widespread use of chemical-mechanical polishing techniques. Chemical solution deposition (CSD) or chemical bath deposition (CBD) uses a liquid precursor, usually a solution of organometallic powders dissolved in an organic solvent. This is a relatively inexpensive, simple thin-film process that produces stoichiometrically accurate crystalline phases.
